

ABSTRACT OF THE DISCLOSURE

A digital camera has a correcting process determining section for determining an image correcting process in accordance with the metering type uses in capturing the
5 image. In the case where spot metering is performed, a correcting process for making a metering area proper is determined, thereby making an image correction in which intention of the user is reflected. In the case where multi-area metering is performed, a metering value and a result of scene determination are transferred from an exposure
10 determining section to a correction controlling section. By using the information obtained in the metering process also for the image correction, the correction time can be shortened.
